Molecular cloning - Wikipedia Molecular cloning is a set of experimental methods in molecular biology that are used to assemble recombinant DNA molecules and to direct their replication within host organisms. The use of the word cloning refers to the fact that the method involves the replication of one molecule to produce a population of cells with identical DNA molecules. Molecular Cloning: Basics and Applications | Protocol Summary. Molecular cloning is a set of methods, which are used to insert recombinant DNA into a vector - a carrier of DNA molecules that will replicate recombinant DNA fragments in host organisms.

Cloning - Wikipedia Cloning is the process of producing genetically identical individuals of an organism either naturally or artificially. In nature, many organisms produce clones through asexual reproduction. Cloning in biotechnology refers to the process of creating clones of organisms or copies of cells or DNA fragments (molecular cloning). Beyond biology, the term refers to the production of multiple copies of. Foundations of Molecular Cloning - Past, Present and ... Molecular cloning has progressed from the cloning of a single DNA fragment to the assembly of multiple DNA components into a single contiguous stretch of DNA. New and emerging technologies seek to transform cloning into a process that is as simple as arranging – blocks – of DNA next to each other. Key Steps of Molecular Cloning Molecular cloning is a process of isolation of a specific DNA fragment and transfer of this fragment into a plasmid vector. As a part of the plasmid vector, the DNA fragment could be easily amplified, sequenced, stored for long periods of time, and used for gene expression and other functional studies.
